

# Upstream Restoration Potential

- Category: Network
- The upstream restoration potential is an index designed to summarize the restoration potential of a barrier. It is a measure of the total upstream river habitat, divided by the number of upstream barriers, and multiplied by the passability scores of downstream barriers.
- Specifically, it is calculated as
$$((((\text{batLenUS} - \text{batFuncUS}) / \text{batCountUS}) + \text{batFunUS}) * \text{dsPasabilityProduct})$$
- Unit: Index
- Sort Order: Descending
- GIS Field Name: usRestPot
