

Downstream Functional Network Length

- Category: Network
- Length of the functional network downstream of a barrier. The functional network is defined by those sections of river that a fish could theoretically access from any other point within that functional network. Its terminal ends are barriers, headwaters, and/or the river mouth. This metric is used in the generation of other metrics. It is not available for prioritizations.
- Unit: meters (converted to miles in some outputs)
- Sort Order: Descending
- GIS Field Name: batFuncUS
